5. Cardiovascular Disease & Stroke

64: Self-Reported Heart Disease

66: Heart Disease Management

68: Heart Disease Mortality

70: Heart Disease Mortality Across Life Span

72: Stroke Mortality

185: Map 3: AI/AN age-adjusted heart disease mortality rates by health district

186: Map 4: AI/AN age-adjusted stroke mortality rates by health district
Heart disease (also known as cardiovascular disease, ischemic heart disease or coronary artery disease) is the leading cause of death in the United States. AI/AN have similar rates of self-reported and diagnosed heart disease compared to NHW but higher rates of hospitalization and death due to these causes. Risk factors for heart disease include smoking, sedentary lifestyle and obesity. Other medical conditions that increase the risk of developing heart disease include hypertension, diabetes and hyperlipidemia. Heart disease is more common in men compared to women and increases with age.

Efforts to prevent heart disease in AI/AN include smoking cessation, dietary counseling, exercise programs and control of blood pressure, blood sugar and cholesterol. The Department of Health and Human Services launched a campaign in 2011 to prevent 1 million heart attacks and strokes by 2017—the Million Hearts campaign. Many of the efforts outlined by this campaign to prevent heart disease are tracked by IHS through the Government Performance and Reporting Act. IHS is working to prevent heart disease by setting goals for the control of blood pressure, diabetes, cholesterol, and obesity, and increasing smoking cessation.

Despite efforts at all levels of care, heart disease remains the number one killer of AI/AN in Idaho, and AI/AN are significantly more likely to die from the disease than NHW in the state. This disparity is greatest among younger AI/AN.

Stroke is another of the top ten causes of death for Idaho AI/AN, but rates are much lower than for heart disease. Looking at both sexes combined there was no disparity relative to NHW; female AI/AN did have 50% higher rates of stroke death than female NHW.
Self-Reported Heart Disease

Figure 5.1 shows the percentage of AI/AN and NHW adults who have ever been told they had angina or coronary heart disease by a health care provider. From 2006-2012, AI/AN males and AI/AN females had similar rates of self-reported heart disease (2.5% and 2.9% respectively). Compared to NHW, AI/AN did not experience a disparity in prevalence of self-reported heart disease.

Data Source: 2006 – 2012 CDC BRFSS

Data Notes: The BRFSS prevalence estimates (shown as a percentage) are weighted to make the survey responses representative of the Idaho population. The sample sizes presented below the figures are the unweighted number of people who answered this question for the indicated years.
Figure 5.1: Prevalence of self-reported heart disease by race and sex, Idaho, 2006-2012.

Sample sizes (n): AI/AN males=468; AI/AN females=770; NHW males=31,987; NHW females=49,551.

Data Source:
2006 – 2012  CDC BRFSS

Data Notes:
The BRFSS prevalence estimates (shown as a percentage) are weighted to make the survey responses representative of the Idaho population. The sample sizes presented below the figures are the unweighted number of people who answered this question for the indicated years.

Sample sizes (n): AI/AN males=468; AI/AN females=770; NHW males=31,987; NHW females=49,551.
IHS has a performance goal for the percentage of adult heart disease patients who receive a comprehensive cardiovascular disease (CVD) assessment. Prior to 2012, IHS measured the percentage of AI/AN patients ages 22 and older with ischemic heart disease who received a comprehensive CVD assessment. In 2013, IHS changed the definition to the percentage of AI/AN patients ages 22 and older with coronary heart disease who received a CVD assessment. A comprehensive CVD assessment includes having the following:

- blood pressure measured at least twice in the past two years;
- low-density lipoprotein (LDL) cholesterol measured in the past year;
- tobacco use screened in the past year;
- BMI calculated in the past year; and,
- lifestyle adaptation counseling (e.g., nutrition counseling, exercise education) in past year.

Since 2010, the percentage of at-risk patients who received a comprehensive CVD assessment has increased for Idaho clinics, the Portland Area IHS, and the national IHS (Figure 5.2). In 2013, all three areas exceeded the IHS goal of 32.3%.

Data Source: Portland Area Indian Health Service.

Data Notes: Data labels only shown for Idaho clinics. The shaded area shows the year when the definition for comprehensive CVD assessment changed.

Idaho clinics include non-urban federal and tribal Indian health facilities in Idaho. Portland Area IHS clinics include non-urban federal and tribal Indian health facilities in Idaho, Oregon, and Washington.
Heart Disease Management

The IHS has a performance goal for the percentage of adult heart disease patients who receive a comprehensive cardiovascular disease (CVD) assessment. Prior to 2012, the IHS measured the percentage of AI/AN patients ages 22 and older with ischemic heart disease who received a comprehensive CVD assessment. In 2013, the IHS changed the definition to the percentage of AI/AN patients ages 22 and older with coronary heart disease who received a CVD assessment. A comprehensive CVD assessment includes having the following:

- blood pressure measured at least twice in the past two years;
- low-density lipoprotein (LDL) cholesterol measured in the past five years;
- tobacco use screened in the past year;
- BMI calculated in the past year; and,
- lifestyle adaptation counseling (e.g., nutrition counseling, exercise education) in past year.

Since 2010, the percentage of at-risk patients who received a comprehensive CVD assessment has increased for Idaho clinics, the Portland Area IHS, and the national IHS (Figure XX). Idaho clinics have exceeded the IHS national average, the 2013 goal, and the Portland IHS area on this measure since 2011.

Figure 5.2: Percentage of IHS AI/AN patients (ages 22 years and older) with heart disease who received a comprehensive CVD assessment.

Note: Data labels only shown for Idaho clinics.

The shaded area shows the year when the definition for comprehensive CVD assessment changed.

Data Source: Portland Area Indian Health Service.

Data Notes: Idaho clinics include non-urban federal and tribal Indian health facilities in Idaho. Portland Area IHS clinics include non-urban federal and tribal Indian health facilities in Idaho, Oregon, and Washington.
Heart disease is the number one killer for Idaho AI/AN. Figure 5.3 shows the age-adjusted death rates for heart disease among AI/AN and NHW in Idaho. Male and female rates are very similar for AI/AN. Compared to NHW, AI/AN heart disease death rates are 20% higher (Table 5.1). This disparity is attributable to the fact that AI/AN women are 1.4 times more likely to die from heart disease than NHW women. Male AI/AN heart disease mortality rates did not differ from NHW males.

Among AI/AN in the Northwest region, Idaho AI/AN have lower heart disease death rates than Washington’s AI/AN population, but higher rates than those seen in Oregon AI/AN.

Data Source: Idaho Death Certificate File (Idaho Dept. of Health and Welfare), 2006-2012, corrected for misclassified AI/AN race
Heart disease is the number one killer for Idaho AI/ANs. Figure 5.3 shows the age-adjusted death rates for heart disease among AI/ANs and NHWs in Idaho. Male and female rates are very similar for AI/ANs. Compared to NHWs, AI/AN heart disease death rates are 20% higher (Table 5.2). Compared to the rest of the Northwest region, Idaho AI/ANs fall in the middle with lower heart disease death rates than found among Washington populations, but higher rates than those seen in Oregon.

Figure 5.3: Age-adjusted heart disease mortality rates by race and sex, Idaho, 2006-2012.
While the majority of heart disease deaths for both populations occurred in the older ages, the disparity was largest among 30-39-year-olds, with AI/AN 2.4 times more likely to die from heart disease in this age group (Figure 5.4). The rate ratio declined steadily throughout the life span, and by age 70 there was no statistically significant difference between AI/AN and NHW in heart disease death rates.

Data Source: Idaho Death Certificate File (Idaho Dept. of Health and Welfare), 2006-2012, corrected for misclassified AI/AN race
Figure 5.4: Age-specific heart disease mortality rates by race and sex, Idaho, 2006-2012.

Note: Rate Ratio is a comparison of AI/AN to NHW rates; a value above 1 indicates AI/AN rates are higher than NHW. Black markers are shown for age groups in which the AI/AN rates are statistically significantly higher than NHW rates. Categories for which AI/AN had fewer than 5 deaths are not shown (0 – 29 years).

Data Notes:
- Rates are not comparable with those published before 2013 due to change in population estimates.
- AI/AN includes all deaths with any mention of AI/AN race in either the Idaho state death certificate data or the Northwest Tribal Registry (NTR), which is maintained by the IDEA-NW Project at NPAIHB.
Stroke is the eighth leading cause of death for Idaho AI/AN, accounting for about 4% of all deaths. Figure 5.5 shows the age-adjusted death rates for stroke among AI/AN and NHW in Idaho. AI/AN females have almost double the risk of death from stroke compared to males, and are 50% more likely to die than NHW females (Table 5.2). Idaho AI/AN have lower rates of stroke than other AI/AN in the Northwest region.

Data Source: Idaho Death Certificate File (Idaho Dept. of Health and Welfare), 2006-2012, corrected for misclassified AI/AN race
Stroke is the eighth leading cause of death for Idaho American Indians and Alaska Natives (AI/ANs), accounting for about 4% of all deaths.

Figure 5.5 shows the age-adjusted death rates for stroke among AI/ANs and non-Hispanic Whites (NHWs) in Idaho. Female AI/ANs are almost twice more likely to die of the disease than males, and 50% more likely to die than NHW females. However, looking at both sexes combined there is no statistically significant difference between AI/AN and NHW stroke mortality rates (Table XX). Idaho AI/ANs have lower rates of stroke than other AI/ANs in the Northwest region.
